

## **Background and methods**

As of November 26<sup>th</sup> 2020, the Democratic Republic of the Congo (DRC) [reported](#) more than 12,300 Coronavirus disease (COVID-19) confirmed cases and around 331 deaths. The pandemic and the accompanying strict precautionary measures have burdened health systems globally, and their indirect effects on the health of women and newborns are expected to exceed the direct impacts of the SARS-CoV-2 virus infection among this population. This document summarises the findings from the second round of a global online survey of maternal and newborn health professionals working in DRC, and includes responses received between July 19<sup>th</sup> and November 7<sup>th</sup>, 2020, and one response submitted in November 2020. This brief presents healthcare providers' and facilities' preparedness and response levels to COVID-19, and describes their experiences and challenges with the progression of the pandemic.

The survey collected data on the respondents' background (country and region, qualification and work responsibilities, gender, and basic characteristics of the health facility in which the respondents worked, if any). To avoid concerns over confidentiality, we did not collect names of health facilities. The questionnaire included three core modules focusing on preparedness for COVID-19, response to COVID-19, and health workers' own experience of work during the COVID-19 pandemic. In the fourth, optional module, we asked respondents to elaborate on adaptations to care processes (service availability, shift timing, modality of contact with patients during various types of outpatient and inpatient care) and content (frequency of routine visits during pregnancy and after childbirth, regulations around companions, length of stay after childbirth, etc.). An invitation to complete the survey was distributed networks of the multi-country research team members, maternal/newborn platforms, and social media. The findings presented in this brief are not intended to be generalizable to maternal healthcare providers who work in the DRC. The objective is to explore and document respondents' experiences, the challenges that they faced, and adaptations to care provision that they adopted to overcome the bottlenecks of the pandemic. Additional information about the methodology of this survey, including the questionnaire, is available in the summary of global responses published [here](#) and on the [study website](#).

## **List of abbreviations**

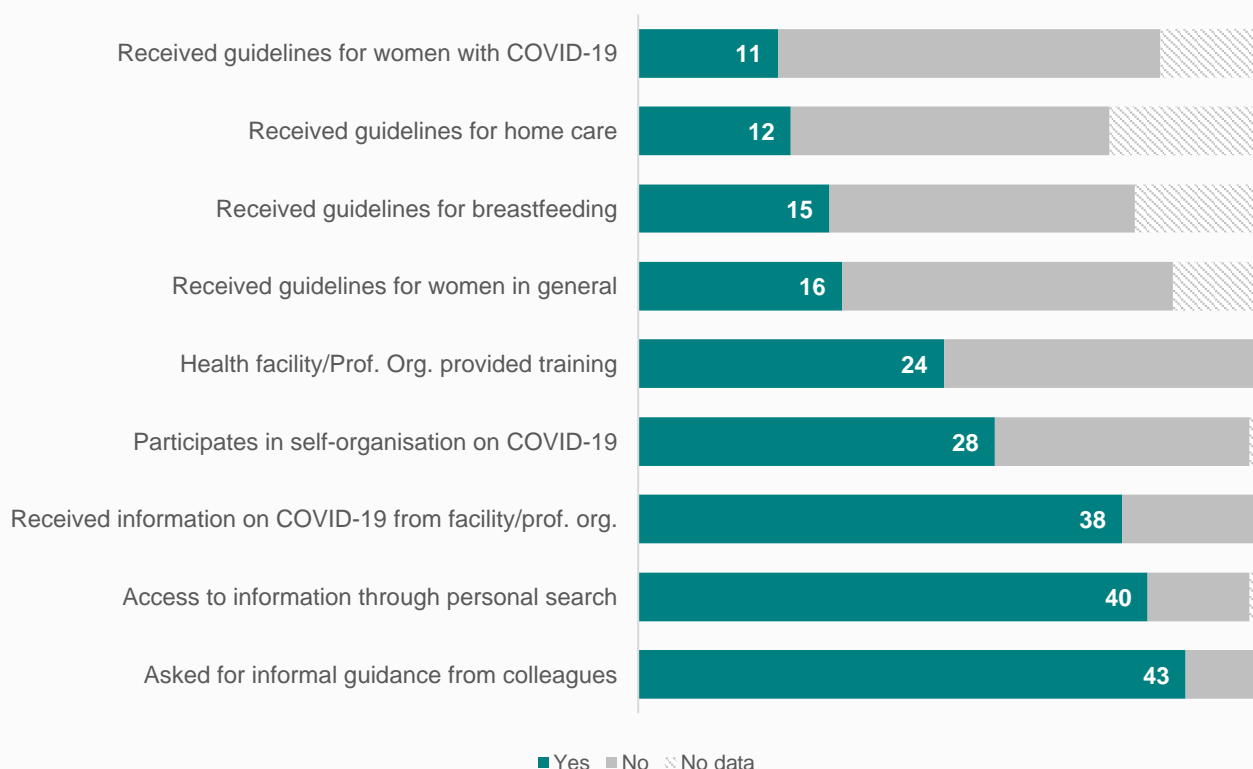

<b>ANC/CPN</b>	Antenatal care/Consultations prenatales
<b>COVID</b>	Coronavirus Disease
<b>csection</b>	caesarean section
<b>DK</b>	Don't know
<b>IPC</b>	Infection prevention and Control
<b>Prof. Org.</b>	Professional organisation
<b>PPE</b>	Personal Protective Equipment
<b>PNC</b>	Postnatal care
<b>Susp/conf</b>	Suspected or confirmed cases
<b>Obs/Gyn</b>	Obstetrician/Gynaecologist

## **Respondents' characteristics**

We report data from 49 healthcare professionals working in DRC, two thirds of whom agreed to answer the optional module (n=32). The majority of the respondents were medical doctors (n=32), followed by nurses (n=8). Most of the respondents were team leaders or department heads (n=30), a quarter were team members (n=12), and five respondents were independent or self-practicing. Eight of the 49 respondents were females. Respondents mainly provided outpatient and inpatient antenatal and postnatal care, inpatient childbirth care, and family planning counselling. Eight respondents worked in Kinshasa, and five respondents worked in each of the following provinces: Haut-Lomami, Kasai-Oriental, and South Kivu. Half of the healthcare providers worked in more than one facility (n=26). Most of the respondents worked in referral hospitals (n=18), followed by clinics (n=12). Two thirds of the healthcare workers provided care in public sector facilities (n=30), and three quarters worked in urban areas (n=36) while 10 worked in villages.

### Dashboard 1. Health providers' access to information, guidelines and training (n=49)

Three quarters of healthcare providers (n=38) received information on COVID-19 and maternity care from their facilities or professional organisations, and around half (n=24) received training and simulations in the month preceding their response to the survey. Around one third of respondents received guidelines on care provision to women in general during COVID-19 and guidelines for breastfeeding practices (n=16 and n=15 respectively), and one in five respondents (n=11) received guidelines on provision of maternal care to women suspected or confirmed with COVID-19 in the month preceding the response the survey.

Out of the **healthcare providers** who received information from their health facilities or professional organisations (n=38), 27 respondents received them through face to face sessions.

In these information sessions, the majority of respondents reported receiving information on **hand hygiene** (n=29), **the correct use of personal protective equipment** (n=28), **distancing between patients and/or visitors** (n=26), and **screening patients for COVID-19 symptoms** (n=25).

Two fifths of maternal and newborn healthcare providers perceived that they were **mostly or very clear** (n=21) on what to do in case they receive a COVID-19 patient.

**Dashboard 2. Women’s access to information and respectful care**

■ Yes ■ No ▨ Don't know

Six of the 20 respondents mentioned that the information materials were **updated in the past month.**

Commonly reported forms of sharing information materials with women were **social media and fliers.**

■ Yes ■ No ▨ Don't know

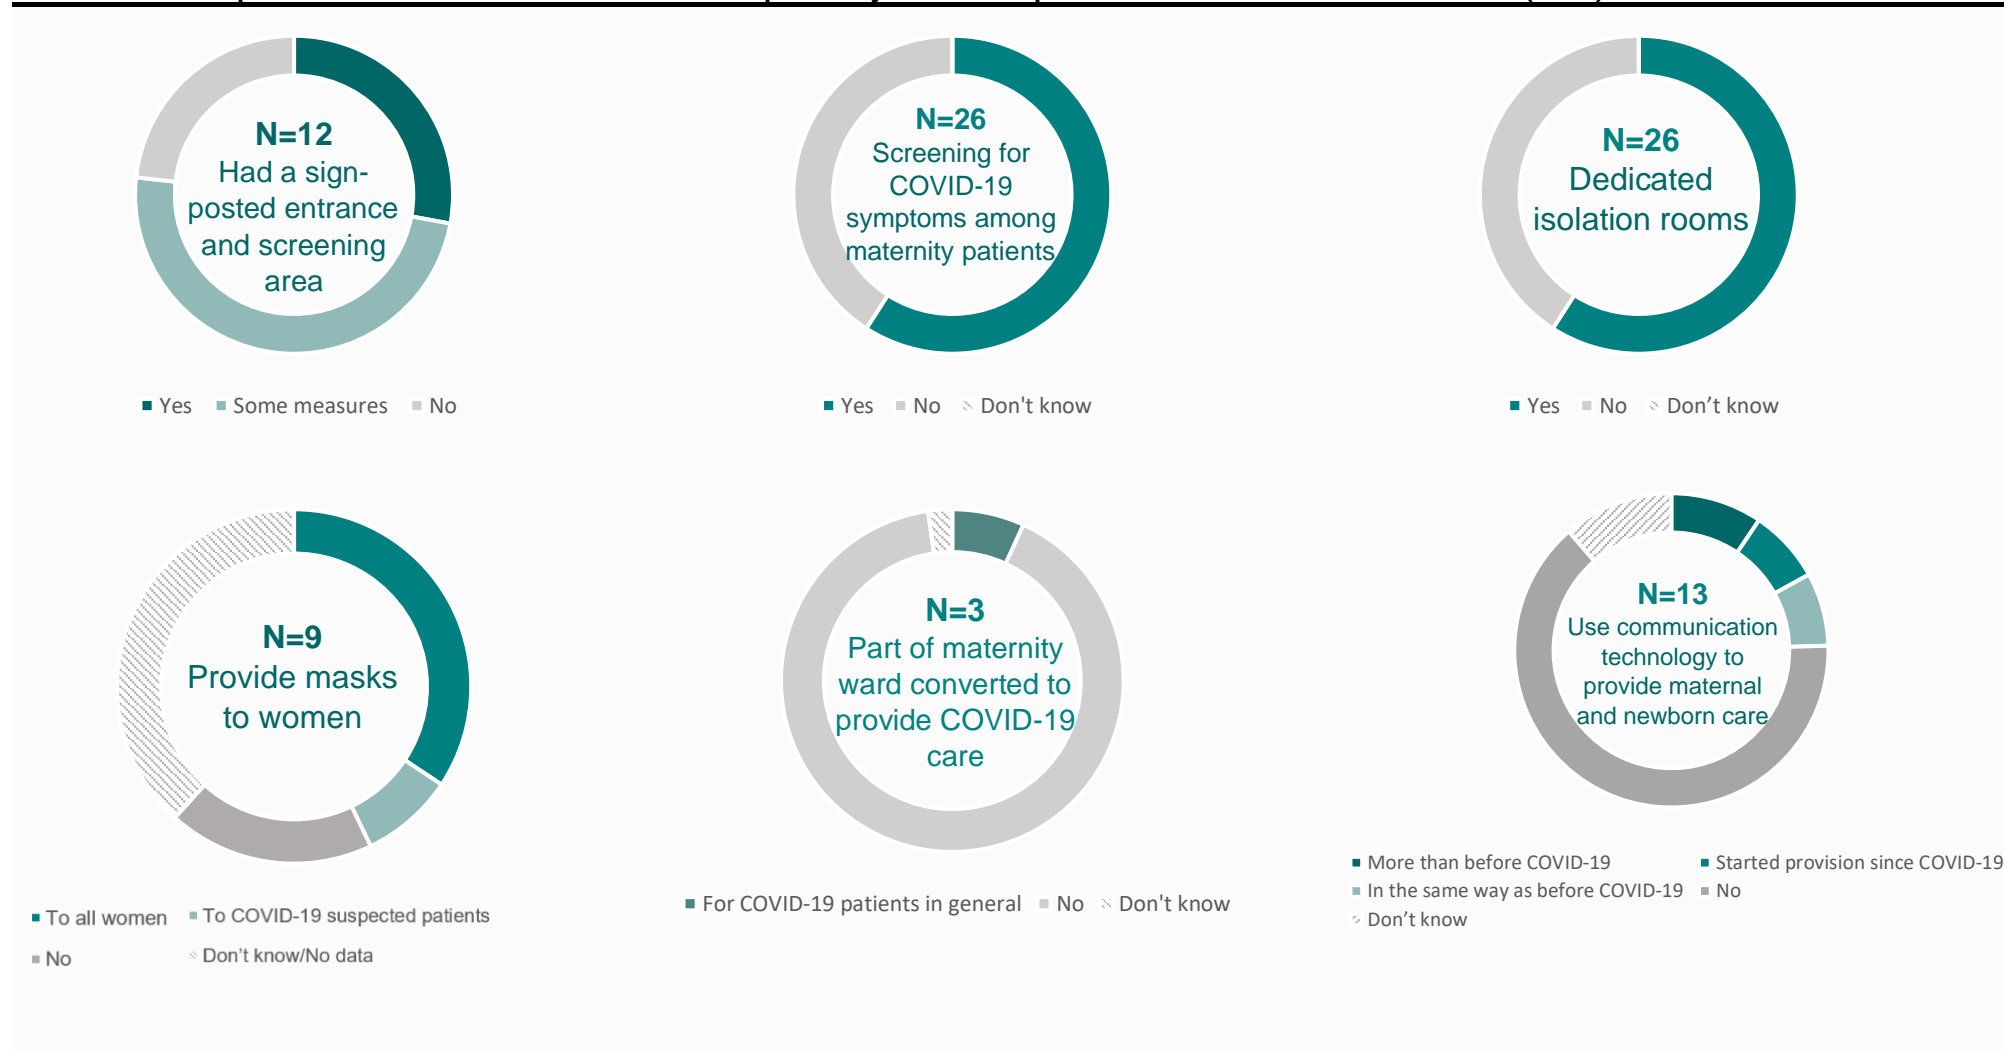

**Perceived ability to provide respectful care compared to before the outbreak**

**Areas of care where the ability to provide the same standards of care have decreased (according to respondents)**

- Antenatal care
- Childbirth care
- Infection prevention measures when caring for babies of mothers infected with COVID-19
- Breastfeeding support
- Family planning counselling

**Dashboard 3. Response at the level of health facilities as reported by healthcare providers who work at health facilities (n=44)**

## Testing for COVID-19

Only three respondents said that they are routinely testing all maternity patients at their respective health facilities, two respondents said that they are routinely testing all newborns of COVID-19 suspected/confirmed mothers.

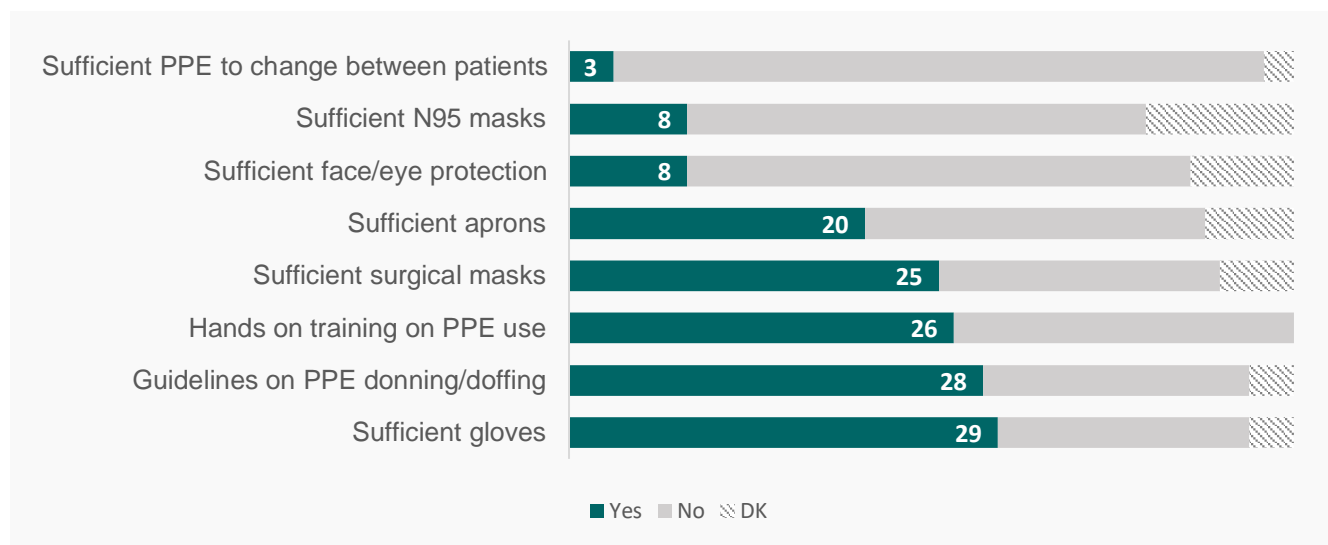

The majority of those who confirmed that it is possible to order a PCR test for maternity **reported that the test is free of charge** (n=12/14).

The timing to receive the test results ranged between 2-3 days, reaching up to more than a week for half of the respondents (n=7/14)

### Possibility to get tested as a healthcare worker

**Dashboard 4. Healthcare provider access to PPE, perceptions of protection and experiences (n=49)**

**Degree of feeling protected in the workplace**

**Stress levels in the previous month as compared to the start of the COVID-19 outbreak**

**Access to formal mental health support**

### Staffing level during the past month compared to the beginning of the outbreak

■ Easily ■ With some difficulty ■ High difficulty ■ Don't know

Common reported causes of the decrease in the number of staff:

- Staff unable to reach the workplace (n=5)
- Staff isolating following exposure to COVID-19 (n=4)

### Feels valued by community

■ 1 - Not at all ■ 2 - Very little ■ 3 - Somewhat ■ 4 - Highly ■ Unsure/don't know

### Facility addressed respondents' concerns

■ 1 - Not at all ■ 2 - Minimally ■ 3 - Somewhat ■ 4 - Well ■ Don't know

### Exposure to violence in their work

■ Yes ■ No ■ Don't know

Commonly reported types of aggressive behaviors were:

- Verbal aggression (n=4)
- Intimidation or threats (n=4)

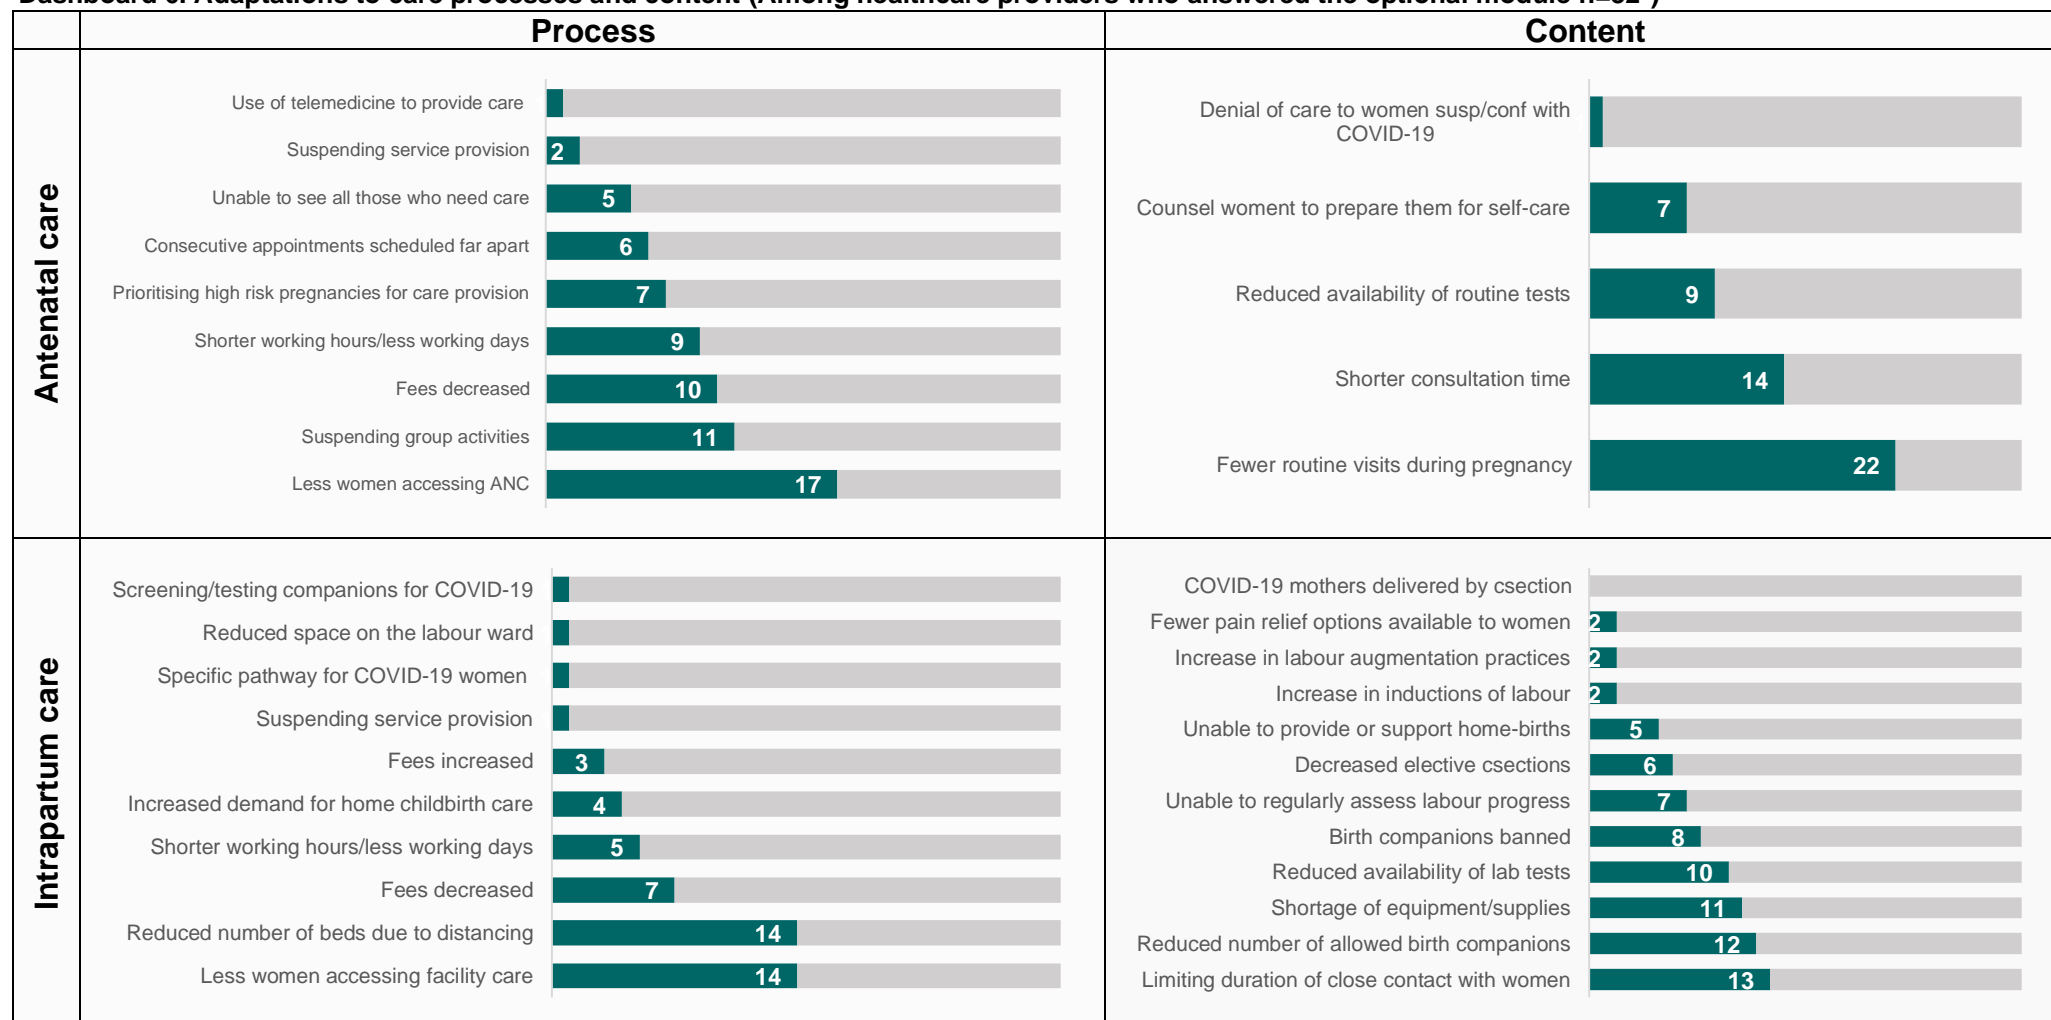

Most commonly reported **targets/victims** are the respondents' colleagues (n=5) and friends/relatives (n=4) and respondents themselves (n=3).

Most commonly reported **perpetrators** are community members (n=3), friends/relatives (n=3) and patients' families (n=2).
